**Robust, safe design.** Rugged, fully-welded carbon steel frame comes complete with a stainless steel ventilated collar. Full stainless steel construction is available as an option.

**Fill by volume or weight.** The adjustable framework will straddle a pallet, or an optional platform scale with controller to ensure accurate bag filling by weight.

**Total product containment.**

The bulk bag spout is clamped around a ventilated collar arrangement which ensures that product is collected and contained within the bulk bag.

The bulk bag is held in position by four spring-loaded retaining hooks.

**Fully movable option.** A fork-lift (FLT) option is available which enables the Filler to be easily moved to different locations.

**Dust control.** As the bulk bag is filled, displaced air is vented to the atmosphere via an exhaust stub located on the ventilated collar. The stub is supplied with a dust sock which can also be removed for connection to your plant's dust collection system.

**Customizable for your process.** Design modifications can be undertaken to adapt the Filler for the requirements of your process and application.

If you are handling product/material in FIBC (Bulk Bags),
